AC022809.6 GI:20429562
On Mar 23, 2001 this sequence version replaced gi:6957981.
Sequence submitted by:
Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory, MS 64-121
Berkeley, CA 94720
This sequence was assembled using end sequences from a whole genome shotgun and from subclones of this BAC and its neighboring clones.
For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu.

AL SUDMILEAC (01-7015) Human Genome Sequencing Center, Department of Wolecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Jun 29, 2005 this sequence version replaced gi:67972682.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.chc.mic.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contigs-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

consists of 27 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

6 Molecular and Human Genetics, Baylor College of Medicine, One Baylor Blaza, Houston, TX 77030, USA

7 Molecular and Human Genetics, Baylor College of Medicine, One Baylor Blaza, Education of Bac based reads and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequence contige are contige actived and oriented, and separated in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contige actived and sequence only stand sequence contige are consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contige will be indicated in the feature table.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug
                                                                                                                    Sequences AAZ55546-Z55551 represent cDNA sequences encoding canine interleukin-5 (IL-5). The invention relates to canine IL-4, canine or feline FIL-1 ligand, canine or feline CD40, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including
                                 Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding immunoregulatory proteins from cats or dogs,

Sequences AA255546-25551 represent cDNA sequences encoding canine interleukin-5 (IL-5). The invention relates to canine IL-4, canine or feline CD14 (CD40) ligand, canine or feline CD15. The invention relates to canine or feline CD154 (CD40) ligand, canine IL-5, canine IL-13, feline interferon-alpha (IRN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autolmmune or infectious diseases including
                                                                                                                                                                                                                                                                                                                                                                                                                          allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense obligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug
useful for treating or preventing e.g. tumors or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           G; 120 T; 0 U; 0 Other;

Sequences AAZ55546-Z5551 represent cDNA sequences encoding canine interleukin-5 (IL-5). The invention relates to canine IL-4, canine or feline Filt-3 interleukin-5 (IL-5). The invention relates to canine or feline CD14 (CD40 igand), canine IL-5, canine or feline CD40, canine or feline GD40 and feline graunlocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleid acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of a contivity, while the antibodies may be used in detection, and in drug Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease. Novel canine interleukin 5 polymucleotide and polypeptides are used for generating antibodies which are useful in treating allergies in dogs.

Claim 31; Page 46; 48pp; English.

The present invention provides the protein and coding sequences of the canina interleukin-5 (IL-5) protein. This can be used to treat allergies, cancer and inflammatory reactions in dogs. The present sequence is one version of the IL-5 coding sequence shown in the specification

```
Sequences AAZES546-Z5551 represent cDNA sequences encoding canine contenterleukin-5 (IL-5). The invention relates to canine IL-4, canine or feline CD154 (CD40 claime Pit-3 ligand), canine or feline CD40, canine or feline CD154 (CD40 claime granulocyte macrophage colony-stimulating factor (GMCSF), and feline granulocyte macrophage colony-stimulating factor (GMCSF), and conclectides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used for therapeutic or prophylactic regulation of an immune considered as vaccines for therapeutic or prophylactic regulation of an immune considered and seasons including allergies, tumours, inflammation and graft rejection, and to increase the creaponse from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while considered fare used for therapeutics (e.g., antisanse oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                           Interleukin-5; IL-5; antibody; canine; inhibitor; immune response; immunoregulation; tumour; cancer; autoimmune disease; vaccine; ss.
                                                                                                                                                                             12

                                                                                                                                                                                                                                                                                 Sequences AAZ55546-Z5551 represent cDNA sequences encoding canine interleukin-5 (IL-5). The invention relates to canine IL-4, canine or feline Fil-3 ligand, canine or feline CD40, canine or feline CD54 (CD40 ilgand), canine IL-5, canine IL-3, feline interferon-alpha (IRN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nuclectides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune may be used to treat autoimmune or infectious diseases including any be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can relate the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and encourses of inhibitory therapeutics (e.g., antisense oligonucleotides).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease

This invention describes a novel nucleic acid vaccine for preventing and curing human and pork cysticercosis. The invention involves the formation of a eukaryotic expression plasmid from fusion transcript expression unit consisting of three protective antigen genes (CCI, CCI and CC4) of pig tental cysticercus and coexpression unit of related cell factor gamma interferon (IRN-gamma) and pork interleukin 5 (IL-5)] genes. The production and purification process of said nucleic acid vaccine is simple and convenient, the physical and chemical properties of the vaccine are stable, and the vaccine is easy to store and transport, and possesses effective immunological protective function for human and pig cysticercosis. This sequence represents the pig IL-5 gene used in the method of the invention
The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in drug targetting

                                                                                                                                                           ð
                                                                                                                                                                                                                                                                                                  The sequences given in AAT50755-56 encode ovine interleukin-5 (IL-5).

Ovine IL-5 or IL-12 are used to treat and/or prevent infections in livestock (esp. cows and sheep), particularly where the animals are stressed, e.g. during transport. IL-5 and IL-12 can also be used as adjuvants in vaccines for veterinary use (partic. weakly immunogenic adjuvants in vaccines for veterinary use (partic. weakly immunogenic companies of adjuvants in vaccines for promote growth or early maturity. Optionally cancer, immunosuppression and allergy, to enhance/suppress the cancer, immunosuppression and allergy, to enhance/suppress the reproductive system and to promote growth or early maturity. Optionally cancer interleukin can be delivered from constructs or delivery cells and anticolar are immunopotentiators, especially IL-5 promotes growth of early haematopoietic progenitor cells and generation of cytotoxic cells from thymnocytes, also it stimulates production and secretion of IgM and IgA (in synergism with bacterial endotoxin). IL-12 induces production of gamma-interferon by, and proliferation of T and NK cells and increases the (nn-1)specific cytolytic lymphocyte response, The Constructs can also be used for in vitro production of IL-5 or - IL-12 (Updated on 17-OCT-2003 to standardise OS field)

New DNA sequence encoding polyketide synthase, useful for the production polyketides such as antibiotic monensin.

```
Claim 1; Page 116-195; 212pp; English.
```

The invention relates to a july a sequence of 10351 base pairs appearing as ABX04971, or its variant, that it is not a sequence encoding all or part amino acids 1-920 encoded by mon AI cas given in the specification. The DNA is the S. cinnamonensis polyketide antibiotic momensin biosynthetic gene cluster. Also included are a combinant cloning or expression vector comprising the gene cluster, a recombinant cloning or expression vector comprising the gene cluster, a cransformed host cell which has been transformed to contain the gene cluster (and is capable of expressing a corresponding polypeptide), a cluster (and is capable of expressing gene cluster (for identification and isolation of the same or analogous gene cluster; e.g. one which binds specifically to a region of the monensin gene cluster (for identification and isolation of the mon RI gene or variant and a monensin promoter to grecifically to a region of the monensin gene cluster (preferably comprising mon BI, mon BII, mon AIX or mon AX or their (preferably comprising mon BI, mon BII, mon AIX or mon AX or their (preferably comprising mon BI, mon BII, mon AIX or mon AX or their correct enhanced levels of production of monensin comprising encoded by mon CII, producing S. cinnamonensis capable of control elevels of production of monensin comprising encoded by mon CII, producing S. cinnamonensis capable of control envels of production of monensin comprising multiple copies or control gene and dexpressing the gene under control of the encoding a heterologous gene and expressing the gene under control of cativator gene mon RI or actillorf4 and 13-propyl erythromycin. The concoding a heterologous gene and expressing the gene under control of cativator gene mon RI or actillorf4 and 13-propyl erythromycins) are corrected by processes and materials (enzyme systems, nucleic acids and vectors) are corrected antibungals, antibacterials or other pharmaceuticals. In particular the gene is useful for the production of monensin or publy and publication of publy entails Sequence 103599 BP; 13980 A; 37023 C; 37799 G; 14795 T; 0 U; 2 Other; ds; gene; human; ROCK 1; hyperproliferative disorder; cancer. 98149 TTCTCTGTGCACGAGCCGATGTCACGTCTGGTCGCCGAA 98187 1 PheAlaValGluAsnProMetAsnArgLeuValAlaGlu 13 0000 Length: Matches: Conservative: Mismatches: Indels: US-10-787-382-20 (1-15) x ABX04971 (1-103599) ADP69744 standard; DNA; 312477 BP 11-DEC-2002; 2002US-00317883. 2002US-00317883. 6.01e+03 46.00 84.62% 69.23% 62.16% (first entry) (ISIS-) ISIS PHARM INC.                                                                                                                                                                                                                     ò
                                                                          The invention relates to a new compound, targeted to a nucleic acid encoding ROCK 1, that specifically hybridises with the nucleic acid encoding ROCK 1 and inhibite expression of ROCK 1. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorder, e.g. cancer. The present sequence represents human ROCK 1 DNA.
                                                                                                                                               Sequence 312477 BP; 92110 A; 58460 C; 60155 G; 98196 T; 0 U; 3556 Other;

The invention discloses a composition comprising two or more isolated rat derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence the expression of a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
encompasses plant expression vectors which comprise the PMMV envelope gene. The present sequence represents cDNA encoding the PMMV envelope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, ds, gene; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

activity in an animal of one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human DNA (shown in Table 2 of the specification) which encodes one of the polypeptides of the invention which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                    ftp.wipo.int/pub/published_pct_sequences.

a Or Library of polynucleotides for diagnosing a cancerous state of mammalian cell and detecting cancer, particularly of the colon prostate, comprises 3351 human polynucleotide sequences.

Claim 9; Page 977; 1046pp; English.

The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed

genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polymucleotides. The probes can be used for chromosome mapping of the polymucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polymucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and antibodies against them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia, dysplasia and hyperplasia

WPI; 2002-557818/59.

Novel DNA array useful for determining differential expression of Methylococcus capsulatus genes, comprises polynucleotides or oligonucleotides representative for a selective number of Methylococcus capsulatus genes.

Claim 14; Page 519; 678pp; English.

The invention relates to a novel DNA array giving a representation of a number of Methylococcus capsulatus genes. The method of the invention is useful for determination of the differential expression of the genes of M. capsulatus, and for studying gene expression on a genomic scale and in

```
Novel recombinant Eps15 homology domain containing protein useful for regulating endogenous EHD protein by regulating insulin-like growth factor 1 receptor cell signaling via altered clathrin coated pit mediated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel recombinant Epsis homology (EH) domain containing protein 1 or 2 (EHD) or EHD2) with an N-terminal region containing a nucleotide binding consensus site, a central coiled coil structure and a C-terminal region including an EH domain, where the polypeptide participates in endocytosis. The peptides, peptide analogues and/or the polynucleotide sequences are useful for regulating EHD1/2 protein activity in vivo, where the EHD1/2 protein and its gene are useful for upregulating the protein activity. The novel method is useful for lowering the rate of IGP1 signaling and therefore useful for suppressing adheaion, invasion and metastasis where EHD is overexpressed, and therefore endocytosis. The method is also useful for elongating IGP1 effects and therefore for increasing bone formation in osteoporosis conditions. This polynucleotide sequence represents the genomic DNA of a mouse EHD1 gene of the invention
gene expression assays of M. capsulatus genes. The sequences shown in ABQ90016-ABQ91855 represent M. capsulatus genes for use in arrays of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cytostatic, osteopathic; recombinant Eps15 homology; EH domain; EHD1; EHD2; endocytosis; IGF1 signaling; suppressing adhesion; invasion; metastasis; bone formation; osteoporosis; mouse; murine; gene; ds.

The present invention relates to novel DNA and protein sequences which are associated with carcinomas. The sequences are useful for: (1) for screening drug candidates; (1) for screening of bioactive agent capable of bidding to Carcinoma Associated Protein (CAP); (11) for screening of a bioactive agent capable of modulating the activity of CAP; (1v) for evaluating the effect of a candidate carcinoma drug; (v) for diagnosing carcinoma; (vi) for inhibiting the activity of CAP; (vii) for reating carcinoma; (vii) for neutralizing the effect of CAP; (vii) for treating carcinoma; (viii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CA coding sequence. Note: This patent is an equivalent to basic patent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recombinant nucleic acid useful for diagnosis and treatment of carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              BP; 20930 A; 14938 C; 16429 G; 21180 T; 0 U; 294 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel polynucleotide probes for detecting hepatitis E virus polynucleotides which contain a sequence of at least 8 consecutive nucleotides of the hepatitis E virus genomic sequences are derived from various strains of the Japanese Hepatitis E virus. The probes and primers are applicable in chips and kits for detecting hepatitis B virus and its infection. This sequence represents a fragment of the genome from Hepatitis E virus strain JMY-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide probes and primers originating in Japanese hepatitis E virus, applicable in chips and kits for detecting hepatitis E virus and its infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ë

The invention relates to novel polynucleotide probes for detecting hepatitis E virus polynucleotides which contain a sequence of at least 8 consecutive nucleotides of the hepatitis E virus genome. The hepatitis E virus genomic sequences are derived from various strains of the Japanese Hepatitis E virus. The probes and primers are applicable in chips and kits for detecting hepatitis B virus and its infection. This sequence represents a fragment of the genome from Hepatitis E virus strain JRA1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibacterial; fungicide; insecticide; polymorphism; genetic analysis; detection; food; gene expression; plant; animal; microorganism; toxin; antibiotic; biopesticide; virulence factor; disease model; plague; whooping cough; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens and related species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/identification of P. luminescens. e.g. in foods. The genes, proteins. Ab and cells that carry a gene-containing vector are used to select compounds that modulate, regulate, induce or inhibit expression of the genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. luminescens. Cells transformed to express the genes are useful for recombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The genes, proteins, vectors containing the genes and Ab are also useful are sensitive to P. luminescens and infection by bacteria or fungi that are sensitive to P. luminescens encoded toxins or antibiotics) and as biopesticides. Other uses of the genes and the proteins are as virulence factors and for identifying targets of human diseases for which P. Luminescens is a model [particularly plague and whooping cough). This
                                                                                                                                                                                                                  Genomic seguence of Photorhabdus luminescens and encoded polypeptides, useful e.g. as therapeutic antimicrobials and agricultural pesticides.

The invention relates to a method of identifying compounds that influence fat cell number or size comprising providing a cell that expresses a gene and an agent, exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the agent. The method also comprises providing a change in expression of the gene control of the agent, reating a subject with the agent and identifying fat cell control of the agent, treating a subject with the agent and identifying fat cell number or size in the subject with the agent comprises an antisense oligonucleotide. The subject comprises a mammal, preferably a human. The oligonucleotide to the agent, detecting binding of the agent to the agent, exposing the polypeptide to the agent, detecting binding of the agent to the agent or a change in an activity of the polypeptide, treating a cubject with the agent comprises an antibody. A method of regulating fat cell subject or size comprises providing a subject containing fat cells and an agent that changes the expression of a gene, and treating the subject with the agent under conditions so that fat cell size or number in the comprise providing a subject containing fat cells and an agent that changes the expression of a gene, and treating the subject confined is useful for identifying compounds that influence fat cell number or size, for preparing a composition for treating or preventing obesity or diabetes. This sequence represents fly confined in the scope of the invention.
Identifying compounds that influence fat cell number or size for treating or preventing obesity or diabetes by exposing the cell to the agent and identifying fat cell number or size relative to cells not exposed to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Drosophila; developmental biology; cell signalling; insecticide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Drosophila melanogaster genomic polynucleotide SEQ ID NO 41938.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 924 BP; 232 A; 254 C; 269 G; 169 T; 0 U; 0 Other;

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant comprising the recombinant DNA construct and growing the transforming a plant with the recombinant DNA construct is useful for improving plant with the comproved properties. The recombinant DNA construct is useful for improving plant with the improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to hearbicides, extreme osmocia conditions, pathogens or peress. CC tolerance to berbicides, extreme osmocia conditions, pathogens or peress. CC content, improved yield by modification of carbohydrate, introgen or content, improved yield by modification of carbohydrate, introgen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved lignin production of improved galactomannan content improved lignin production of improved galactomannan content of the invention. Note: The sequence data for this patent did format from part of the printed appearation but was obtained in electronic format from INPTO at seedata instract.
                                                                                                                                                                                                                                                                                             New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1545 BP; 220 A; 601 C; 525 G; 199 T; 0 U; 0 Other;

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176, ABL30511), expressed DNA sequences (ABL16176, ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; cold tolerance; nest tolerance; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polynucleotide; gene; ss.
                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; SEQ ID NO 41938; 21pp + Sequence Listing; English

The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete document is available on CD-ROM
                                                                                                                                                                               New isolated protein complexes useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of disease disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bauer A, Gavin A, Superti-Furga G, Kuester B, Schultz J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to identifying a stress condition to which a plant cell has been exposed, comprising: (a) contacting nucleic acid arrepresentative of expressed polynucleotides in the plant cell with an array or probes representative of the plant cell genome; and (b) detecting a profile of expressed polynucleotides in the plant cell characteristic of a stress response. The method is useful in the production of transgenic plants, cells and seeds and in producing with increased tolerance to abloric stress. The present sequence is that of an Arabidopsis thaliana stress regulated gene (ABZ12196-ABZ17574) used not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                       Identifying a stress condition to which a plant cell has been exposed and producing plants with increased tolerance to these abiotic stresses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Multiprotein complex; eukaryote; drug target; diagnosis; gene; ds.

The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are useful as targets for an active agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in disapnosing or creening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in sceening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament for the treatment or prevention of a disease or disorder. This sequence corresponds to a gene of the invention. (Note: the sequence data for this part of the printed specification but was obtained from the EPO in electronic format).
                                                      듸
                                                        useful as targets
                                                    New proteins and protein complexes from eukaryotes, useful as targets drug screening, or in diagnosing or screening for the presence of a disease or disorder, or a predisposition for developing a disease or

                                                                                                     The invention relates to novel polynucleotide probes for detecting hepatitis E virus polynucleotides which contain a sequence of at least 8 consecutive nucleotides of the hepatitis E virus genome. The hepatitis E virus genomic sequences are derived from various strains of the Japanese Hepatitis E virus. The probes and primers are applicable in chips and kits for detecting hepatitis E virus and its infection. This sequence represents a fragment of the open reading frame 1 from the Hepatitis E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
Polynucleotide probes and primers originating in Japanese hepatitis E virus, applicable in chips and kits for detecting hepatitis E virus and its infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             solated nucleic acid detection reagent for detecting 1000 or more from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila, developmental biology, cell signalling, insecticide,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P26, of Arabidopsis thaliana. Pathogen-inducible promoters were identified in an experiment in which gene expression in wild-type Col-0 Arabidopsis plants was monitored over the course of a Botytis cinerea infection. Genes were identified whose expression was up-regulated during pathogen infection compared to uninfected tissue, and promoter sequences were isolated by PCR amplification. The promoters can be used to enhance pathogen resistance in plants, e.g. by being operably linked to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid molecule useful for enhancing resistance of a plant to a pathogen (e.g. bacteria, viruses, fungi, nematodes or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       present sequence is that of a pathogen-inducible promoter, denoted
sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Promoter; plant; pathogen resistance; transgenic; crop protection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   U; 0 Other;

The invention relates to novel polymucleotide probes for detecting hepatitis B virus polymucleotides which contain a sequence of at least 8 consecutive nucleotides of the hepatitis E virus genome. The hepatitis E virus genome crangences are derived from various strains of the Japanese Hepatitis E virus. The probes and primers are applicable in chips and kits for detecting hepatitis E virus and its and infection. This sequence represents the open reading frame 1 from the Hepatitis E virus strain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide probes and primers originating in Japanese hepatitis E virus, applicable in chips and kits for detecting hepatitis E virus and its infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 5138 BP; 966 A; 1470 C; 1380 G; 1322 T; 0 U; 0 Other;

Polynucleotide probes and primers originating in Japanese hepatitis E virus, applicable in chips and kits for detecting hepatitis E virus and its infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel polynucleotide probes for detecting hepatitis E virus polynucleotides which contain a sequence of at least consecutive nucleotides of the hepatitis E virus genome. The hepatitis ganomic sequences are derived from various strains of the Japanes Hepatitis E virus. The probes and primers are applicable in chips and kits for detecting hepatitis E virus and its infection. This sequence represents the genomic sequence from the Hepatitis E virus strain JRAL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 7230 BP; 1344 A; 2120 C; 1880 G; 1886 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

Polynucleotide probes and primers originating in Japanese hepatitis B virus, applicable in chips and kits for detecting hepatitis E virus and its infection.

Claim 1; SEQ ID NO 45; 238pp; Japanese.

hepatitis E virus polynucleotides which contain a sequence of at least 8 consecutive nucleotides of the hepatitis E virus genome. The hepatitis E virus genomic sequences are derived from various strains of the Japanese Hepatitis E virus. The probes and primers are applicable in chips and kits for detecting hepatitis E virus and its infection. This sequence represents the genomic sequence from the Hepatitis E virus strain JMY-The invention relates to novel polynucleotide probes for detecting

The invention relates to a method of predicting at least one toxic effect of a compound by obtaining a gene expression profile of a tissue or cell sample exposed to the compound and comparing the gene expression profile to a database of toxicity prediction genes which are differentially expressed on exposure to known toxins. The tissue or cell sample is preferrably derived from heart tissue, and the predicted toxic effect is cappecially a cardiotoxic effect, and the predicted toxic effect is cappecially a cardiotoxic effect, and the predicted toxic effect is cappecially a cardiotoxic effect, and the prediction, hypotension, dyspnea, cardiogenic shock or other specific heart pathologies. The invention is based on the elucidation of global changes in gene cardiotoxins, and the identification of global changes in gene cardiotoxins, and the identification of individual genes (toxicity markers) that are differentially expressed on toxin exposure. The navention also relates to methods for predicting the progression of a compound, for identifying an agent that modulates the onset or pathways a particular compound will modulate. The invention further pathways a particular compound will modulate. The invention further relates to sets of at least two hybridization probes specific for conforming the toxic effects (especially cardiotoxic effects) of predicting the toxic effects (especially cardiotoxic effects) of compounds such as pharmaceutical agents or ravizonmental pollutants. Sequences ADV39135.ADV41830 represent cardiotoxicity marker polymucleotides of rat origin whose expression is altered on exposure to at least one cardiotoxin. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antieense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Zyskind JW;

concing a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide of the fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the satisfication or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or required for proliferation, or that inhibits cellular proliferation; (8) capathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound acts; (9) manufacturing an antibiotic; (10) profilling a compound the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of the which each of the strains is present in a culture or collection of an organism. The antisense nucleic acids are useful for identifying proceins or screening for homologous nucleic acids required for callular proliferation to solate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           299 TTTGGGGTGCTCACCAATATCTTCATTGATTGTTGAAACGCTG 255

```

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart with a microarrays. By measuring gene expression, the probes are useful for predicting, disgnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic

format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences

```
The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids sequences ("Ily defined in the specification." The probe is a single exon probe that thybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or issues. Also included are a spatially—advensable set of single exon nucleic acid probes for measuring human gene expression, a method of addressably isolatable or amplifiable from the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a vector comprising the single exon addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a vector comprising the single exon probe cited above, where each of the plurality of probes is separately and probe solutionally with conservative amino acid substitutionally, and conservative amino acid substitutionally, and conservative amino acid substitutionally, and soluted antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure geneither antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or a customer desiring to measure gene expression, a method of providing human gene expression data by subscription, and a computer-readable conservation and which contains a database having a plurality of records (each record including data on the expression of a single exon microarrays. In addition, the probes may be used as tools for surveying crited above. The probes are used in identifying and characterising grows alterative splicing events, in detecting and characterising grows andlers and or form part of the p
gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for surveying tissues.
                                                                                                                                                                                                                                                     Claim 15; SEQ ID NO 6169; 80pp; English.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the vipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ASPP; iASPP; inhibitory ASPP; apoptosis; tumour suppressor protein; p53;
                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 913 BP; 276 A; 218 C; 225 G; 194 T; 0 U; 0 Other;

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed catholic transfer in the setul in gene therapy techniques to restore normal catholic fill of activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies shaded in medical imaging cof supplement. (II) and (II) are useful for treating disorders in polypeptide and polymucleotide sequences have applications in disponsition for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cannot be considered the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the format disconting and the printed specification, but was obtained in the format differency from MIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder, ss.
                                                                                                                                                                                                                                                                           New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 2518 BP; 717 A; 627 C; 588 G; 586 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to inhibitory ASPP (IASPP) polypeptides and encoding polynucleotides from human and nematode. The IASPP polypeptide inhibits the apoptotic activity of the tumour suppressor protein p53. The methods and reagents of the invention are useful for inducing apoptosis by inhibiting the activity of IASPP on p53, and especially for treating cancer. The present sequence represents a nematode iASPP polypeptide encoding cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ASPP) and other associated
the inhibitory effect of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; chromosome mapping; gene mapping; gene therapy; forensic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) is useful in gene therapy techniques to restore normal control of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restore normal consecution antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The constitue, genetic genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and confine sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this coding sequences of the invention. Note: The sequence data for this confine the printed specification, but was obtained in company of the invention are sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    :
                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      88; gene; human; gene therapy; diagnostic marker; pharmaceutical.

The invention relates to a novel human polynuclectide and the encoded polypeptide. A polynuclectide of the invention may have a use in gene therapy. An oligonuclectide of the invention ADM06202-ADM06773 is useful as a primer for synthesizing the polynuclectide or as a probe for detecting the polynuclectide. The polynuclectides ADM01316-ADM01378 are useful in gene therapy, for developing a diagnostic marker or medicines for requlating their expression and activity, or as a target of gene therapy. The proteins ADM03759-ADM06201 encoded by the polynuclectides are useful as pharmaceutical agents. The present sequence represents a cDNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Drosophila melanogaster expressed polynucleotide SEQ ID NO 39308.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Drosophila; developmental biology; cell signalling; insecticide;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
